

AppCheck Webinar
Thursday 26th September - 11am or 3pm
XSS Everywhere! What is it, why should I care, and how can I avoid it?

The team here at AppCheck would like to invite you and your colleagues to our next 1-hour Webinar surrounding the intricate challenges of XSS. We ran this session at The Cyber Hack Theatre at IPEXPO London whereby over 500 delegates attended the two 1-hour sessions.

Synopsis:

Cross-Site Scripting (XSS) is by far the most widespread high impact vulnerability, present even in the best of web applications, regardless of the framework or programming language employed - a burly steadfast member of the OWASP Top Ten.

Here at AppCheck the client-side nature of typical XSS has led to a general underappreciation of its exploitation potential, though a good understanding of the vulnerability and its subtle variations will show how it can be used to devastating effect... and more importantly: how it can be avoided.

In this seminar we will build up piece-by-piece an understanding of XSS that spares no detail.

Benefit to the delegate:

- A short 1-hour Webinar Training session on Web Application Security and the challenges faced
- Unlimited delegates per organisation, therefore a FREE 1-hour training session for all personnel
- An understanding of XSS and the core conditions from which it arises
- An appreciation of the exploitation potential of XSS
- A discussion on in-built browser protections and mitigations for XSS and their limitations
- An insight into the variants of XSS: Reflected, Persistent, and DOM-based
- An understanding of how to avoid XSS
- Speaker is an expert in the field with 10 + years pen testing experience and now heads up AppCheck's Research & Development programme
- The client can also book a free assessment using our automated penetration testing tool (prior to or following the webinar) against an owned target of their choice
